

Timothy Chen – Portfolio

OPERATIONS ANALYST

PROJECT COORDINATOR

DEC 2025 GRADUATE

Analytical **December 2025** Neuroscience graduate and certified Project Management and Data Analytics professional with a proven track record of optimizing operational workflows and driving a **37%** increase in repeat sales volume. Experienced in utilizing Python as well as structured data to bridge the communication gap between technical engineering teams and international stakeholders to maximize organizational efficiency and system reliability.

Revenue Impact

+37% repeat sales volume driven through strategic program design

Systems Engineering

Production-grade trading infrastructure with full restart-safe continuity

Team Leadership

Trained **10+** new hires and directed high-pressure operational shifts

Operational
Tracking

Operations Case Study: Generating Repeat Customer Sales

IFCHIC · GLOBAL FASHION LOGISTICS

The Challenge

I was tasked with navigating extreme seasonality and persistent "revenue valleys" in global fashion logistics across a portfolio of **250+** accounts. The business was operating in a purely reactive model – responding to churn rather than preventing it.

My Approach

I engineered a multi-tiered **Loyalty Rewards Program** to transition the organization from reactive damage control to a proactive retention and revenue growth engine.

How I Solved It

Incentive Alignment

Implemented point-based incentives to increase customer switching costs and foster long-term brand loyalty across seasonal cycles.

Inventory Liquidation

Analyzed warehouse data using **SQL** to identify "Dead Stock" and launched targeted "Point Booster" promotions – moving aged inventory without the margin loss of traditional discounting.

Response Standard

Maintained a strict **<24-hour** response time standard across all **250+** accounts throughout the program rollout.

37%

Repeat Sales Growth

Increase in repeat sales volume achieved through the loyalty program

250+

Accounts Managed

Global fashion accounts navigated through seasonal revenue valleys

<24hr

Response Time

Maintained response standard across all accounts during program execution

Cross-Industry Versatility: Dual-Vertical Operations Management

The FMCG Vertical

IFCHIC · GLOBAL FASHION LOGISTICS

Navigating high-speed seasonal cycles and global fashion logistics for international accounts.

Operational Goal: Strategic revenue stabilization through data-driven loyalty programs + "Point-Booster" promotions.

Operational Scalability & Process Design

Demonstrated the ability to maintain rigorous service standards across disparate product lifecycles. By applying a unified process logic, I ensured that high-speed fashion trends and high-precision industrial hardware were managed with the same level of operational discipline and reliability.

The Industrial Vertical

KS TERMINALS · EV INDUSTRIAL COMPONENTS

Managing technical engineering communications for international EV component distribution.

Operational Goal: Ensuring fulfillment reliability and technical accuracy for high-precision industrial hardware.

Strategic Communication

Successfully acted as the technical and cultural bridge between sales executives and engineering teams, translating diverse industry requirements into a single, cohesive warehouse workflow. This improved execution accuracy by ensuring that each team worked from the same operational standard.

Technical Systems: Operationalizing Project Julie

TRADING BOT · PRODUCTION INFRASTRUCTURE · SYSTEMS ARCHITECTURE

I re-engineered a high-complexity trading codebase into a managed, restart-safe production workspace. This system follows a **Log-Driven Observer Architecture**, and below is the full operational flow I architected – from workspace initialization through live order execution and state persistence.

Within this **Log-Driven Observer Architecture**, every component – from broker authentication to live order placement – operates inside a structured, observable, and recoverable pipeline.

Process Integrity

I developed cross-platform **Singleton Locks** to prevent duplicate execution instances, eliminating the risk of orphaned processes and accidental double-exposure in live trading environments.

Observability Layer

I built a **Log-Driven Observer Architecture** dashboard bridge that translates raw runtime logs into structured JSON "Health Snapshots," providing real-time visibility into account discovery and session state at all times.

Architecture, Risk Mitigation & Continuity

SYSTEM DESIGN · RESILIENCE ENGINEERING · RISK CONTROLS

1

Filterless Live Mode

I transitioned to a "**Filterless**" **Live Mode** to reduce system coupling, making the production path significantly easier to reason about, debug, and promote from research artifacts into live execution. This streamlined architecture also reduced unnecessary branching logic, improved traceability across the execution path, and made it far easier to isolate issues when conditions changed in real time.

2

Async Resilience

I implemented independent async tasks for heartbeat checks and position syncing, ensuring that health monitoring **never stalls** behind heavy strategy calculations — keeping the system responsive under load. By decoupling monitoring from strategy evaluation, the platform could continue reporting accurate state, detect interruptions faster, and avoid cascading delays during volatile market activity.

3

Restart-Safe Continuity

I engineered a persistence engine that saves runtime state to `bot_state.json`, allowing the system to recover its exact session context and risk accounting after any interruption or forced restart. That meant open positions, execution history, and control-state could be restored consistently, reducing operational drift and preserving continuity across deployment cycles.

4

Comprehensive Risk Controls

I integrated a full test suite covering high-risk edge cases including **bracket conflicts**, anti-flip handling, and parallel trade guards — ensuring production safety across all execution scenarios. These checks validated the most failure-prone paths before release, helping prevent conflicting orders, accidental reversals, and duplicate exposure in live trading conditions.

📌 Every architectural decision I made was driven by a single principle: the system must be **observable, recoverable, and safe** — even under the most adverse runtime conditions.

Leadership, Mentorship & Operational Continuity

1

Medical Scribe Ambassador

I trained **10+** new hires in fast-paced clinical environments, breaking down documentation workflows step by step, reinforcing quality standards, and setting clear expectations for accuracy, speed, and consistency. By coaching teammates in real time and modeling best practices, I helped new staff become confident and reliable contributors more quickly.

My approach emphasized careful review, standardized workflows, and steady feedback so that patient records stayed complete, precise, and consistent across every shift.

Impact Metrics

10+

New Hires Trained

Built team readiness and set the quality standard.

20+

Line Items Managed

Maintained precise oversight across shift operations.

100%

Product Availability

Ensured full continuity through structured handoffs.

2

McDonald's Crew Manager

I led **6-8** team members at a time through high-pressure shifts, coordinated **50+** line items, and kept operations moving smoothly by managing priorities, resolving issues quickly, and maintaining clear communication across the team. I strictly utilized and maintained standardized handoff logs to preserve continuity between shifts and reduce the risk of missed tasks or inventory gaps.

That process helped maintain **100%** product availability, ensured accountability during busy periods, and created a dependable rhythm for smooth, uninterrupted operations.

Objective: Seeking Technical Project Coordinator or Operations Analyst roles where I can leverage my background in data-driven system reliability and global logistics.
